Dear Ms. Esther Barajas-Ochoa,,

Before adopting a "No Significant Risk Level (NSRL) of 1100 micrograms per day for glyphosate" I believe there is a need to present to the public, compelling research based on epidemiological studies related to the impacts of low, or any amount of Glyphosate, a known Chemical Causing Cancer.

Additionally, research related to the negative impacts of glyphosate must also be carefully reviewed and presented to the public.

Yours for the safety of Californians,

Mayra Gomez
